The invention relates to a human sphingosine kinase-like protein. The polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. asthma), autoimmune diseases (e.g. rheumatoid arthritis) and central and peripheral nervous system disorders (e.g. parkinson's disease). The present sequence represents the human sphingosine kinase-like protein

Claim 25; Fig 11; 120pp; English.

                                                                                                                                                                                                                                                                                       The invention relates to a human sphingosine kinase-like protein. The polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (eathmal, autoimmune diseases (e.g. rheumatoid arthritis) and central an peripheral nervous system disorders (e.g. Parkinson's disease). The present sequence represents the human sphingosine kinase-like protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EMLEKLISRPKHLLVFINPFGGKGQGKRIYERKVAPLFTLASITTDIIVTEHANQAKETL

obesity, or New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing pharmacogenomics

Claim 1; Page 135; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell

Comprising the above vector; (e) an antibody chart immunospeciation to binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aborrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide. NovX sequences have antidiabetic, anorectic, antibacterial, virucide, or preventing a pathology associated with the above polypeptide. NoVX sequences have antidiabetic, anorectic, antibacterial, virucide, and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic conservances; immune disorders such as Alzheimer's disease or Parkinson's caid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes to obesity, infections, cachexia, cancer, caidmolecules, inchromosome mapping, tissue typing, preventive medicine and conservance or probes, in chromosome mapping, tissue typing, preventive medicine and conservance. an antibody that immunospecifically above vector; (6) present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel isolated, enriched or purified nucleic acid molecule that encodes a kinase polypeptide. Specifically, it relates to human tyrosine and serine/threonine protein kinases (PTK's and STK's), as well as protein kinase-like enzymes. The present invention describes screening methods to identify agonists, antagonists and antibodies that can be used to modulate the activity or function of the mammalian kinase enzymes. As such, these compositions can be used for gene therapy purposes to treat diseases or disorders including cancer, immune-related diseases, cardiovascular disease, brain or neuronal associated disease, metabolic and inflammatory disorders. Accordingly, they exhibit cytostatic, neuroprotective, immunomodulator and antiinflammatory activities. This polypeptide sequence is a human kinase protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EETDVHGKHQGSGKWQKMEKPYAFTVHCVKRARRHRWKWAQVTFWCPEEQLCHLWLQTLR 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the abstrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX by supplementing the patient our production or to rectify with the cereased conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polypeptides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify medulators (agonists and antagonists) of the expression and activity of NOVX. The cused to modulate NOVX polypurcleotide expression and activity of NOVX cused to modulate NOVX polypurcleotide expression and activity of NOVX polypeptides. The anti-NOVX polypeptide antibodies agonists and antagonists may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX

polypeptides and polynucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, haematopoietic disorders, and the various dyslipidaemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       82
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, ceramide kinase, hCERKI; drug screening, gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       જે
                                                                                                                                                                                                                            This sequence represents a human ceramide kinase designated hCERKI. The invention relates to hCERKI, nucleic acids encoding it, expression vectors and host cells containing hCERKI nucleic acids, the recombinant production of hCERKI and antibodies specific for hCERKI. The invention also encompasses methods of isolating hCERKI from samples, the use of hCERKI in drug screening, and the use of hCERKI nucleic acid sequences in gene therapy. hCERKI mediates the ATP-dependent 1-phosphorylation of coramides and can be used to screen for therapeutic and preventive agents for a wide range of disorders. Such disorders include neurological disease, inflammation, human immunodeficiency virus (HIV) infection, type 2 diabetes, obesity, sepsis, arteriosclerosis and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           145

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                KETLYEINIDKYDGIVCVGGDGMFSEVLHGLIGRTQRSAGVDQNHPRAVLVPSSLRIGII 261
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to human sphingosine kinase 4 (SPHK4; ABR56301). The kinase can be used for the diagnosis and treatment of sphingosine related disorders. The kinase can also be potentially used for controlling toxicity of platelet transfusion and as a platelet stabiliser. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             IKDSEKKRWLGLARYDFSGLKTFLSHHCYEGTVSFLPAQHTVGSPRDRKPCRAGCFVCRQ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of human sphingosine kinase C (SKC), an enzyme that phosphorylates sphingosine to form sphingosine 1-phosphate. The sequence was deduced from that of a polymucleotide (see AAASOSIO) isolated from an Hela cDNA library. The invention provides polymucleotides (see AAASOSO8-10) and polypeptides (see AAYSOSO8-59) for the human sphingosine kinase (SK) homologues SKA, SKB and SKC. The polypeptides can be obtained using recombinant DNA methods, and host cells containing expression vectors including SK polymucleotides are used in a claimed method of screening for compounds that inhibit or activate human SK activity. Human SK specific antibodies inhibitors, ligands or their analogues can be used as bioactive agents to treat inflammation or disease including viral, bacterial or fungal infections, allergic responses, mechanical injury associated with trauma, hereditary diseases, lymphoma or carcinoma, and other conditions with activate the genes of kidney, lung, heart, lymphoid or tissues of the nervous system
                                                                                                                                                 480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human sphingosine kinase A, B and C polynucleotides and polypeptides useful in e.g. chromosome and gene mapping, and detecting inflammation or disease associated with abnormal levels of sphingosine kinase expression.

associated disorder especially cancer, restenosis or ischemia in a human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to sphingosine kinase (SphK) polypeptides and nucleic acids encoding them. SphK is useful for treating a SphK-associated disorder especially cancers such as leukaemia, lymphoma,

               atherosclerosis, restenosis or ischaemia and cell proliferative disease or disorder associated with vascular diseases. SphK gene is used in gene therapy and antisense-therapy. Sphingolipids serving as signalling molecules, have recently emerged as regulators of cell growth, differentiation, diverse cell phenotypes and cell death. Activation of SphK by tumour necrosis factor (TNP)-alpha inhibits apoptosis in human endothelial cells. The present sequence is human sphingosine kinase
                                                                                                                                                                                                                                                                                                                                   9

The present invention describes an isolated PRO nucleic acid (1). Also described: (1) a vector comprising (1); (2) a host cell comprising the vector of (1); (3) a process for producing a PRO polypeptides; (4) an isolated PRO polypeptide; (5) a chimeric molecule comprising the polypeptide of (4) fused to a heterologous amino acid sequence; (6) an tiopody which specifically binds to a polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4), an agonist or antagonist of the polypeptide or an antibody that binds to the composition of matter comprising a polypeptide of an antibody that binds to the composition of marmal; (10) a method of treating an immune related disease in a marmal of (7); (9) a method of treating an immune related disease in a composition of method for determining the presence of a PRO polypeptide (7); (1) a method of of tetermining the polypeptide; (11) a method of of adantifying a compound that inhibits or cin asmana; (12) a method of stimulating the immune response in a mammal; (12) a method of stimulating the immune response in a mammal; (12) a method of stimulating the immune response in a mammal. The PRO sequences have antialterized, antialamentor, antialterized, antialamentory, antispostatic, antialaberic, antialamentory, antispostatic, antialaberic, antialamentory, antispostatic, antialaberic, antialamentory, antispostatic, antialaberic, antialamentory, antispostatic, antialaberic, antialamentory, antispostatory, vasotropic and virucide activities, and can be used in gene therapy. The nucleic acid (1) and the encoded polypeptides, compositions, kits and methods are cuseful in diagnosing and treating an immune related disease and immune cuseful in diagnosing and treating an immune related disease and an immune cuseful in diagnosing and treating an immune related disease and an immune cuseful in diagnosing and treating an immune related an immune related and purpaptions in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PRO polynucleotides and polypeptides, useful in useful in diagnosing treating an immune related disease, e.g. systemic lumis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cyrostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoietic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic protein of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                       The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal crivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abbrrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for generation expression or blod passes biodiversity and to cid sequences. Aggonolo-Abg30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at (IP) wipo.int/pub/published_pot_essions

The kinase can be used for the diagnosis and treatment of sphingosine related disorders. The kinase can also be potentially used for controlling toxicity of platelet transfusion and as a platelet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DCVCYSTVGTSDAETSALHIVVGDSLAMDVSSVHHNSTLLRYSVSLLGYGFYGDIIKDSE 180

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AgG00010-Ag030377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this electronic format directly from MPO at the vipo.int/pub/published\_pot\_sequences

```
New reagent for modulating the activity of sphingosine kinase-like protein polypeptide or polynuclectide and treating cancer, asthma, allergy, an autoimmune disease, or a central or peripheral nervous system
                                                                                                                                                                                                               The invention relates to a human sphingosine kinase-like protein. The polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. styma), autoimmune diseases (e.g. rheumatoid arthritis) and central and peripheral nervous system disorders (e.g. rexkinson's disease). The present sequence represents the human sphingosine kinase-like protein
                                                                                                                                                                        Claim 25; Fig 2; 120pp; English.

  similarity).
TISSUE SPECIFICITY: High level expression in heart, brain and tissue SPECIFICITY: High level expression in spleen, liver and lung; not detected in skeletal muscle.
DEVELOPMENTAL STAGE: Highly expressed at 7 dpc and decreases
  to form ceramide 1-phosphate. Acts efficiently on natural and analog ceramides (C6, C8, C16 ceramides, and C8-dihydroceramide), to a lesser extent on C2-ceramide and C6-dihydroceramide, but not on other lipids, such as various sphingosines (By similarity). CATALYTIC ACTIVITY: ATP + ceramide = ADP + ceramide 1-phosphate. COFACTOR: Calcium and magnesium (By similarity). SUBCELLUIAR LOCATION: Cytoplasmic and membrane-associated (By
   ceramide
  FUNCTION: Catalyzes specifically the phosphorylation of

   CDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues.

Tissues were provided by Dr. John Todd (Dept. of Medical Genetics Wellcome Trust Centre for Molecular Mechanisms in Disease Wellcome Trust/MCC building Addenbrookes Hospital Cambridge) whose assistence we gratefully acknowledge.

Please visit our web site for further details.

Denatured RNA was size fractionated on a 1% agarose gel.First strand cDNA synthesis was primed with oligo-dT primer containing a Not I site. Double strand cDNA was size selected according to mRNA size fraction, ligated with EcoR I adaptor, digested with NotI and then cloned directionally into pYX-Asc vector. The library tag sequence located between the Not I site and the polyA tail is CAGCACGAC. This library was created for the University lows Brain Anatomy Project (BMAP): "Gene Discovery in the Developing Mouse Nervous System", supported by National Institute of Mental Health (NIMH), Hemin Chin, Ph.D., program coordinator."

Patent No. 6703491

GENERAL INFORMATION

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster FILE REFERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270, 767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: Patentin Ver. 2.0

ERQ ID NO 46720

New reagent for modulating the activity of sphingosine kinase-like protein polypeptide or polynucleotide and treating cancer, asthma, allergy, an autoimmune disease, or a central or peripheral nervous system disorder.

Claim 25; Fig 10; 120pp; English.

The invention relates to a human sphingosine kinase-like protein. The polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. asthma), autoimmune diseases (e.g. rheumatoid arthritis) and central and peripheral nervous system disorders (e.g. Parkinson's disease). The present sequence represents the human sphingosine kinase-like protein

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1, Page 135; 586pp; English

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
comprising the nucleic acid molecule described above; (5) a cell
comprising the above vector; (6) an antibody that immunospecifically
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
comprising a method for determining the presence of or predisposition to
a disease associated with altered levels of expression of the above
co polypeptide or nucleic acid molecule in a first mammalian subject; (9) a
method of identifying a potential therapeutic agent for
a disease associated with the polypeptide on a berrant expression or
above; (10) a method for identifying a potential therapeutic agent for
cuse in treating a pathology that is related to an aberrant expression or
aborrant physiological interactions of the polypeptide; (11) a method of
correcting for a modulator of activity or of latency or predisposition to
corpresenting for a modulator of activity or of latency or predisposition to
corpresenting a pathology associated with the above polypeptide in a
mammal; and (14) a method for producing the above polypeptide in or
corpresenting a pathology associated with the above polypeptide or the
corpression or
corpression or an endiator, optostatic, neuroprotective, antiparkinsonian
and antilipaemic activities, and can be used in gene therapy. The
colypeptide is useful in manufacturing a medicament for treating a
colypeptide is useful in manufacturing a medicament for treating a

This invention relates to a novel isolated, enriched or purified nucleic acid molecule that encodes a kinase polypeptide. Specifically, it relates to human tyrosine and serine/threonine protein kinases (FFK's and STK's), as well as protein kinase-like enzymes. The present invention describes screening methods to identify agonists, antagonists and antibodies that can be used to modulate the activity or function of the mammalian kinase enzymes. As such, these compositions can be used for gene therapy purposes to treat diseases or disorders including cancer, immune-related diseases, cardiovascular disease, brain or neuronal associated disease, metabolic and inflammatory disorders. Accordingly, they exhibit cytostatic, neuroprotective, immunomodulator and antiinflammacory activities. This polypeptide sequence is a human kinase protein sequence

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and condition in human related to the aberrant expression and activity of NOVX polypeptides associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX polypeptides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of crestorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators anti-NOVX polypeptide antibodies, agonists and antagonists may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX colypeptides and polymucleotide may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, altabetmer's pleases, Parkinson's blabsder, immune disorders, disorders, and the various dyslipidaemias, metabolic chancer associated with obesity, the metabolic syndrome X and meant pooletic disorders, and the various dyslipidaemias, metabolic chancer associated with obesity, the metabolic syndrome X and meant and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and antagonial and

   invention relates to hCERKI, nucleic acids encoding it, expression vectors and host cells containing hCERKI nucleic acids, the recombinant production of hCERKI and antibodies specific for hCERKI. The invention also encompasses methods of isolating hCERKI from samples, the use of hCERKI in drug screening, and the use of hCERKI nucleic acid sequences in gene therapy. hCERKI mediates the ATP-dependent 1-phosphorylation of ceramides and can be used to screen for therapeutic and preventive agents for a wide range of disorders. Such disorders include neurological disease, inflammation, human immunodeficiency virus (HIV) infection, type 2 diabetes, obesity, sepsis, arteriosclerosis and cancer

   The present invention relates to human sphingosine kinase 4 (SPHK4; ABR56301). The kinase can be used for the diagnosis and treatment of sphingosine related disorders. The kinase can also be potentially used for controlling toxicity of placelet transfusion and as a platelet stabiliser. The present sequence was used to illustrate the invention

   for treating a SphK-
or ischemia in a human.
   The present invention relates to sphingosine kinase (SphK) polypeptides and nucleic acide encoding them. SphK is useful for treating a SphK-associated disorder especially cancers such as leukaemia, lymphoma, ovarian, breast, lung, colon, testicular, stomach and skin, atheroscierosis, restenosis or ischaemia and cell proliferative disease or disorder associated with vascular diseases. SphK gene is used in gene therapy and antisense-therapy. Sphingolipids serving as signalling

   The present sequence is that of human sphingosine kinase C (SKC), an enzyme that phosphorylates sphingosine to form sphingosine 1-phosphate. The sequence was dedduced from that of a polymucleotide (see AAA50510) isolated from an Hela cDNA library. The invention provides polymucleotides (see AAA50508-10) and polymetides (see AAA50508-10) for the human sphingosine kinase (SK) homologues SKA, SKB and SKC. The polymeptides can be obtained using recombinant DNA methods, and host cells containing expression vectors including SK polymucleotides are used in a claimed method of screening for compounds that inhibit or activate human SK activity. Human SK specific antibodies, inhibitors, ligands or their analogues can be used as bioactive agents to treat inflammation or disease including viral, bacterial or fungal infections, allergic responses, mechanical injury associated with trauma, hereditary diseases, lymphoma or carcinoma, and other conditions with activate the genes of kidney, lung, heart, lymphoid or tissues of the nervous system
  ö
   137
New human sphingosine kinase A, B and C polynucleotides and polypeptides useful in e.g. chromosome and gene mapping, and detecting inflammation or disease associated with abnormal levels of sphingosine kinase expression.

The present invention describes an isolated PRO nucleic acid (I). Also described: (I) a vector comprising (I); (2) a host cell comprising the vector of (I); (3) a process for producing a PRO polypeptides; (4) an isolated PRO polypeptides; (5) a chimeric molecule comprising the cisolated PRO polypeptide; (5) a chimeric molecule comprising the cisolated PRO polypeptide; (7) a national specifically binds to a polypeptide of (4); an agonist or composition of matter comprising a polypeptide or an antibody that binds to the composition of matter of (T); (9) a method of treating an immune related disease in a comprising a container, a label on the container and a composition of marmal; (10) a method for determining the presence of a PRO polypeptide in a sample suspected of having the polypeptide; (II) a method of container and a composition of diagnosing an immune related disease or an inflammatory immune response in a mammal; (12) a method of identifying a compound that inhibits or composition and (13) a method of stimulating the immune response in a mammal. The PRO sequences have antialleragic, antianaemic, antityproid, antianaemic, antityproid, contained antipheratic, antidiabetic, antidialment, immunostimulant, immunostimulant, immunostimulant, and the encoded polypeptides, compositions, kits and methods are useful in diagnosing an immune related disease and in compured to the present invention.

Containing the encoded polypeptides, compositions, kits and methods are useful in diagnosing an immune repensent sequence represents a human containating an immune repense the present sequence represents a human containation.

  The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antiinflammatory, neuroprotective, antianaemic, cytostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoletic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic protein of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.

The internation retails to the state polymetrate for the sequences. (I) is useful a hybridisation probes, polymetrase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II) The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polymeptide in tissue, as molecular weight markers and as a food supporting in tissue, as molecular weight markers and as a food is supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polymeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Abg00010-Abg00377 represent novel human diagnostic mino acid sequences of the invention. Note: The sequence data for this electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at

   The invention relates to a human sphingosine kinase-like protein. The polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. asthma), autoimmune diseases (e.g. rheumatoid arthritis) and central and peripheral nervous system discorders (e.g. Parkinson's disease). The present sequence represents the human sphingosine kinase-like protein

Prediction of the coding sequences of mouse homologues of KIAA
gene: III. the complete nucleotide sequences of 500 mouse
KIAA-homologous cDNAs identified by screening of terminal sequences of GDN clones randomly sampled from size-fractionated libraries
DNA Res. 10 (4), 167-180 (2003)
   /note="CDS is predicted by in silico analysis. Start codon is not identified.
Start codon is not identified."

   Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov Series: IRAK Plate: 141 Row: d Column: 4
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 21703365
This clone has the following problem: The cds is short compared to the longest cds in the locus.

Home sapiens bK29F11.1 full length open reading frame (ORF) cDNA
Clone (cDNA clone C22ORF:pGEM.bK29F11.1).
  Submitted (24 MAY-2004) Sanger Institute, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: c22g@sanger.ac.uk Manuscript Sanger Institute and : pGEM.bK29F11.1
Homo sapiens cDNA sequence. This sequence was generated as part of The Wellcome Trust Sanger Institute program to isolate cDNA clones representing the full length open reading frame of well annotated protein coding genes on human chromosome 22. For more information see http://www.sanger.ac.uk/HGP/Chr22/.

Generation and initial analysis of more than 15,000 full-length
   Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LINL at: http://image.llnl.gov series: IRAK Plate: 141 Row: d Column: 4 This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 27703365 This clone has the following problem: The cds is short compared to the longest cds in the locus.

   Okazaki, N., Kikuno, R., Ohara, R., Inamoto, S., Koseki, H., Hiraoka, S., Saga, Y., Nagase, T., Ohara, O. and Koga, H.
Prediction of the coding sequences of mouse homologues of KIAA
gene: III. the complete nucleotide sequences of 500 mouse
KIAA-homologous cDNAs identified by screening of terminal sequences of cDNA clones randomly sampled from size-fractionated libraries
DNA Res. 10 (4), 167-180 (2003)
  Okazaki, N., Kikuno, R., Nagase, T., Ohara, O. and Koga, H.

Okazaki, N., Kikuno, R., Nagase, T., Ohara, O. and Koga, H.

Direct Submission

Submitted (23-70L-2003) Hisashi Koga, Kazusa DNA Research

Institute, Laboratory for Genome Informatics; 2-6-7

Kazusas-kamatari, Kisarazu, Chiba 292-0818, Japan

The CREATE program supported by Japan science and technology

corporation; cDNA full insert sequencing: Kazusa DNA Research

Institute; cDNA library construction, clone selection and 5'- &
3'-end one pass sequencing.

                             The invention relates to a human sphingosine kinase-like protein. The polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. sathmal, autoimmune diseases (e.g. recurrent and peripheral nervous system disorders (e.g. Parkinson's disease). The present sequence represents the human sphingosine kinase-like protein

  Human, sphingosine kinase, SphK; restenosis, ischaemia, gene therapy; antisense therapy; cancer; sphingolipid; signalling molecule, apptosis; cytostatic; tumour necrosis factor-alpha; TNF; atherosclerosis; lymphoma; leukaemia; vasotropic; cell proliferative disorder; vascular disease; ss.
   The present invention relates to sphingosine kinase (SphK) polypeptides and nucleic acide encoding them. SphK is useful for treating a SphK-associated disorder especially cancers such as leukaemia, lymphoma, ovarian, breast, lung, colon, testicular, stomach and skin, atherosclerosis, restenosis or ischaemia and cell proliferative disease or disorder associated with vascular diseases. SphK gene is used in gene therapy and antisense-therapy. Sphingolipids serving as signalling molecules, have recently emerged as regulators of cell growth, diverse cell phenotypes and cell death. Activation of SphK by tumour necrosis factor (TNF) alpha inhibits apoptosis in human endothelial cells. The present sequence is human sphingosine kinase
  An isolated Sphingosine kinase polypeptide useful for treating a SphK-
associated disorder especially cancer, restenosis or ischemia in a human.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above; (3) an isolated nucleic accontainers, the composition described above; (3) an isolated nucleic acid molecule above; (3) an isolated nucleic acid molecule above; (3) an isolated nucleic acid molecule above; (3) an isolated nucleic acid molecule above; (5) a cell comprising the nucleic acid molecule above; (7) methods for action of the above polypeptide described above; (5) a cell sample; (8) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential threspetuic agent for above; (10) a method for identifying a potential threspetuic agent to use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of activity of the polypeptide described above; (13) method of activity of the polypeptide described above; (13) method of activities and (14) a method for producing the above polypeptide. Novx sequences have antidiabetic, anorectic, antibacterial, virucide, and antilipaemic activities, and can be used in gene therapy. The mammal; and (14) a method for producing the above polypeptide or the nucleic adiadners associated with a human disease. The polypeptide or the nucleic acid anothers and various in chromosome manning the above polypeptide or the nucleic acid activities, and acid described to a prevent metabolic activities, and acid molecule may be used to disances and prevent metabolic acids can also be used as hybridisation or probes; in other prevent acids can also be used a prevent we adiadners and acid a obesity, New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obscancer or dyslipidemia, and in chromosome mapping, tissue typing or 20; Page 134; 586pp; English pharmacogenomics Claim

```
New human sphingosine kinase A, B and C polynucleotides and polypeptides useful in e.g. chromosome and gene mapping, and detecting inflammation or disease associated with abnormal levels of sphingosine kinase expression.
   The present sequence is that of an isolated polynucleotide encoding human sphingosine kinase C (SKC, see AAYS6059), an enzyme that phosphorylates sphingosine to form sphingosine 1-phosphate. The polynucleotide was isolated from an Hela cDNA library by PCR amplification. The invention provides polynucleotides (see AAA50508-10) and polypeptides (see AAY96057-25) for the human sphingosine kinase (SK) homologues SKX, SKB and SKC. The polynucleotides may be used as hybridization probas, in the construction of PCR primers for chromosome and gene mapping, in the recombinant production of SKA, SKB and SKC, and in the generation of antisense DNA or RNA. They can be used to detect inflammation or disease associated with abnormal levels of SK expression, or to detect

New reagent for modulating the activity of sphingosine kinase-like protein polypeptide or polynucleotide and treating cancer, asthma, allergy, an autoimmune disease, or a central or peripheral nervous system
TGACCTCATCCTCATCCGGAAATGCTCCAGGTTCAATTTTCTGAGATTTCTCATCAGGCA 960
  ġ
  The invention relates to a human sphingosine kinase-like protein. The polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. stathmat), autoimmune diseases (e.g. rheumatoid arthritis) and central and peripheral nervous system disorders (e.g. Parkinson's disease). The present sequence represents the human sphingosine kinase-like protein

This invention relates to a novel isolated, enriched or purified nucleic acid molecule that encodes a kinase polypeptide. Specifically, it relates to buman tyrosine and serine/threonine protein kinases (FrK's and STK's), as well as protein kinase-like enzymes. The present invention describes screening methods to identify agonists, antagonists and antibodies that can be used to modulate the activity or function of the mammalian kinase enzymes. As such, these compositions can be used for gene therapy purposes to treat diseases or disorders including cancer, immune-related diseases, cardiovascular disease, brain or neuronal associated disease, metabolic and inflammatory disorders. Accordingly, they exhibit cytostatic, neuroprotective, immunomodulator and antiinflammatory activities. This polynucleotide sequence is a human kinase DNA sequence
  New nucleic acid molecule encoding a kinase polypeptide, useful for preparing a composition for treating diseases or disorders, e.g., cancer, or neurological, immunological or inflammatory disorders.

The present invention describes an isolated even nucleic acid (1). Also described: (1) a vector comprising (1); (2) a host cell comprising the vector of (1); (3) a process for producing a PRO polypeptides; (4) an isolated PRO polypeptide; (5) a chimeric molecule comprising the polypeptide of (4) fused to a heterologous amino acid sequence; (6) an antibody which specifically binds to a polypeptide of (4); (7) a nagonist or composition of matter comprising a polypeptide of (4); (7) an agonist or antagonist of the polypeptide or an antibody that binds to the polypeptide or an antibody that binds to the comprising a container, a label on the container and a composition of matter of (7); (9) a method of treating an immune related disease in a manmal; (10) a method of treating an immune related disease in a composition of a method of didentifying a compound that inhibits or in a sample suspected of having the polypeptide; (11) a method of identifying a compound that inhibits or in manmal; (12) a method of identifying a compound that inhibits or in manmal; (13) a method of stimulating the immune response in a mammal. The PRO sequences have antiallering, antiantener, antialtarmatory, antiporiatic, antithy antiposizatic, antithatmatic, antithatmatory, antiposizatic, antithated, compositions, with an encoded polypeptides, compositions, kits and methods are constructed and in diagnosing and treating an immune related disease and in manner every constructed and indiabetic, antial electron immune therapy. The nucleic acid cusful in diagnosing and treating an immune related disease and in manner constructs and immune related disease and in manner constructs and immune related disease and in manner constructs and immune and indiabetic and immune related disease and in manner and immune and immune related disease and in manner constructs and immune and immune related in processing and immune related in manner.

human polypeptide. The protein encoded by the nucleic acid of the invention relates to the cDNA sequences encoding an isolated novel human polypeptide. The protein encoded by the nucleic acid of the invention is useful for treating central and peripheral nervous system diseases (e.g. peripheral neuropathy, Huntington's disease, amyotrophic clateral sclerosis); neurodegenerative diseases (e.g. Parkinson's disease, amyotrophic crarthematosus, rheumatoid arthritis, insulin-dependent diabetes mellitus) crychematosus, rheumatoid arthritis, insulin-dependent diabetes mellitus); wounds, ulcers, burns; bone disorders (e.g. systemic labetes mellitus); wounds, ulcers, burns; bone disorders (e.g. osteoporosis, osteoarthritis); mechanical and traumatic disorders (e.g. stroke, head trauma); lung or liver fibrosis; reperfusion injury in various tissues; bacterial, viral or fungal infections; allergic conditions such as allergic rhinitis, asthma; coaquiation disorders (e.g. septic shock, Crohn's cancer and tumours; and inflammatory diseases (e.g. septic shock, Crohn's disease, anaphylaxis). The protein may be used to inhibit the growth, crimees, or to effect bodily characteristics, biorhythms or circadian cycles of rhythms. The protein may also have

Cycles of rhythms. The protein may also have

Cycles of rhythms. The protein may also have

Cycles of rhythms sequences of the invention are useful for expressing recombinant protein for analysis. The present sequence represents a novel chamma cDNA sequence of the invention, this sequence is an expressed cycle sequence tag (ESI) and was identified using subtractive hybridisation

  This sequence represents cDNA encoding a human ceramide kinase designated hCERKI. The invention relates to hCERKI, nucleic acids encoding it, expression vectors and host cells containing hCERKI nucleic acids, the recombinant production of hCERKI and antibodies specific for hCERKI. The invention also encompasses methods of isolating hCERKI from samples, the use of hCERKI in drug screening, and the use of hCERKI nucleic acid sequences in gene therapy. hCERKI mediates the ATP-dependent 1 phosphorylation of ceramides and can be used to screen for therapeutic and preventive agents for a wide range of disorders. Such disorders include neurological disease, inflammation, human immunodeficiency virus

The invention relates to isolated NoVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or creat a medical condition in human related to the abbrrant expression and activity of NoVX polypeptides are disorders associated with decreased colymucleotides may be used to treat disorders associated with decreased expression or activity of NoVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules can be daministered to down regulate expression of NoVX polypeptides by binding with the cells own genes and preventing their expression. NoVX binding with the cells own genes and preventing their expression. NoVX polypeptides and complementary sequences may also be used as DNA probbes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of the production of antibodies and in assays to identify modulators the production of antibodies and in assays to identify modulators canciused to modulate NoVX polypeptides and in assays to identify of NoVX. The used to modulate NoVX polypeptide expression and activity of NoVX polypeptides and polynucleotide expression and activity of NoVX polypeptides and polynucleotide may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, and the various dyslipidaemias, metabolic disorders, disorders, immune disorders, hammal popular disorders and hard with chronic dissesses and disorders and hard with chronic dissesses and various cancers.

Colypeptides and sociated with obesity, the metabolic syndrome X and concers.

   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed cativity of (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in the protein protein and polymodical activity assessed to their traits to assess biodiversity and polymeric diagnostics.

                   The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antiniflammatory, heuropoptide. The molecules of the invention demonstrate antiniflammatory, be useful in preparing a composition for diagnosing or treating inflammatory, haematopoletic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic DNA of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the MIPO web-site.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caction (PCR) primers, oligomers, and for chromosome and gene mapping, and diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of supplement. (III) and (III) are useful for treating disorders of involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in the protein expression or biologications in the protein expression or biological activity. The diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AsS494564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this coding sequence of the priversity from WIPO at

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/cloned Denatured RNA was size fractionated on a l% agarose gel. First strand cDNA synthesis was primed with oligo-dT primer containing a Not I site. Double strand cDNA was size fraction. Igated with Ecox I adaptors of digested with Not I and then cloned directionally into pXX-Asc vector. Average insert size 4-5Kb. Adaptors 5'(AMTCGGCACGAGG)3' and 5'd (CCTCGTGCGG)3'. 3' Linker sequence - GCGCCCTCAGAGCC TI8. Sequencing primers 3'end: T3 promoter primer 5'd (TAATACCCTCACTAAAGGGA)3'. S' End: T7 promoter primer 5'd (TAATACCCTCACTATAAGGGA)3'. Library was constructed in the laboratory of M. Bento Soares. Note: this is a NIH_MGC Library.

/ Unce="Vector: pCMV-Sport6; Site 1: Not1; Site 2: Sal1;
This is a long-transcript enriched cDNA library (Genome Res. 11: 1553-1558 (2001). [PMID: 1154199] from WAO1 cell line. Undifferentiated human ES cell line WAO1/H1 was obtained from WiCell Research Institute, Inc., Wadison, Wi, cultured according to their instructions, on MEF feeders. They formed according to their instructions, on MEF feeders. They formed colonies with defined edges and were positive for alkaline phosphatase, SSEA-4, OCT3, OCT4, REX1, UTF, TERT, SOX2, CX43 and CX45. They are negative for GATA2, GATA4, PDX1, NCAM, MSX1, FIT3, SSEA-1, TUBB3, NES, GRAPA, PDXI, NCAM, MSX1, FIT3, SSEA-1, TUBB3, NES, GRAPA, PDXISS. When confluent (10-10 days after plating), the ES cells from 4 X 6cm dishes were treated with 1 mg/ml collagenase, type IV (Invitrogen/GIECO) for 5-10 min and gently scraped off with 5 ml pipette. RNA was purified with TRIZO1 Reagent from Invitrogen. Protocol ref: Genome Res. 11: 1553-1558 (2001). [PMID:11544199] Double-stranded CDNAs were synthesized with an Oligo(dT) primer [Invitrogen:
  3.4g of total RNA, treated with T4 DNA polymeraes, and purified by ethanol-precipitation. The CDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/chloroform extraction, and separated from free linkers by Centricon-100 column. Then, the CDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4-s for 25 cycles. The products were purified by phenol/chloroform extraction and Centricon-100 column. The CDNAs were digested with Sal1 and NotI enzymes and cloned into Sal1/NotI site of pCMV-SPORTE plasmid vector. The average insert size is about 3.6kb."

Direct Submission

L Submitted (12-MAY-2004) Sanger Institute, Hinxton, Cambridgeshire, CID 15A, UK. E-mail enquiries: C22g@sanger.ac.uk Manuscript Sanger Institute name: pGEM. DK29F11.1

Homo sapiens cDNA sequence. This sequence was generated as part of The Wellcome Trust Sanger Institute program to isolate cDNA clones representing the full length open reading frame of well annotated protein coding genes on human chromosome 22. For more information see http://www.sanger.ac.uk/HGP/Chr22/.

   Clone distribution: MGC clone distribution information can be found through the I.M.A.G.B. Consortium/LiML at: http://image.llnl.gov Series: IRAX Plate: 141 Row: d Column: 4 This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 21703365 This clone has the following problem: The cds is short compared to the longest cds in the locus.
  Direct Submission
Submitted (12-MAR-2004) National Institutes of Health, Mammalian
   Gene Collection (MGC), Cancer Genomics Office, National Cancer

E-mail enquiries: chickest@bms.umist.ac.uk BBSRC/Dundee/Nottingham/Sanger/Sheffield/UMIST Gallus gallus cDNA sequencing project. This sequence is from the BBSRC/Dundee/Nottingham/Sanger/Sheffield/UMIST cDNA collection, from a library constructed by Elizabeth Bosch. cDNA was prepared from RNA extracted from heads, normalised, and poly A-trimmed. ECORI-NotI cut cDNA was then ligated into the vector. Vector: pBluescript II KS(+); Site_I: ECORI; Site_2: NotI Host: Escherichia | FEATURES Location/Qualifiers  1. 1450                                 | Alignment Scores:  1.51e-138                                 |

## WPI; 2003-381626/36. P-PSDB; ADA05680.

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

## Claim 20; Page 134; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the nucleic acid molecule described above; (5) a cell
comprising the above vector; (6) an antibody that immunospecifically
comprising the above polypeptide described above; (7) methods for determining the
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
ca disease associated with altered levels of expression of the above
comprising an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therapeutic agent for
above; (10) a method for identifying a potential therapeutic agent for
cuse in treating a pathology that is related to an aberrant expression or
aborrant physiological interactions of the polypeptide; (11) a method of
carriery of the polypeptide described above; (13) method for modulating
con preventing a pathology associated with the above polypeptide in a
mammal; and (14) a method for producing the above polypeptide. NOVX
con preventing a pathology associated with the above polypeptide.
con preventing a pathology associated with the above polypeptide.
con preventing a pathology associated with the above polypeptide.
con preventing a pathology associated with the above polypeptide.
con preventing a pathology associated with the above polypeptide.

```
New reagent for modulating the activity of sphingosine kinase-like protein polypeptide or polynucleotide and treating cancer, asthma, allergy, an autoimmune disease, or a central or peripheral nervous system disorder.
  The invention relates to a human sphingosine kinase-like protein. The polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. sthma), autoimmune diseases (e.g. theumatoid arthritis) and central and peripheral nervous system disorders (e.g. parkinson's disease). The present sequence represents the human sphingosine kinase-like protein

preparing a composition for treating diseases or disorders, e.g., cancer, or neurological, immunological or inflammatory disorders.

Example 1; SEQ ID NO 55; 366pp; English.

This invention relates to a novel isolated, enriched or purified nucleic acid molecule that encodes a kinase polypeptide. Specifically, it relates to human tyrosine and serine/threnoine protein kinases (FYK's and STK's), as well as protein kinase-like enzymes. The present invention describes screening methods to identify agonists, antagonists and antibodies that can be used to modulate the activity or function of the mammalian kinase enzymes. As such, these compositions can be used for gene therapy purposes to treat diseases or disorders including cancer, immune-related diseases, cardiovascular disease, brain or neuronal associated disease, metabolic and inflammatory disorders. Accordingly, they exhibit cytostatic, neuroprotective, immunomodulator and antiinflammatory of the invention.

Claim 2; SEQ ID NO 1223; 3009pp; English.

The present invention describes an isolated PRO nucleic acid (I). Also described: (I) a vector comprising (I); (2) a host cell comprising the vector of (1); (3) a process for producing a PRO polypeptides; (4) an isolated PRO polypeptide; (5) a chimeric molecule comprising the isolated PRO polypeptide; (5) a chimeric molecule comprising the polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4); (7) a composition of matter comprising a polypeptide of (4); (7) a comprising a container, a label on the container and a composition of matter of (7); (9) a method of treating an immune related disease in a mammal; (10) a method for determining the presence of a PRO polypeptide in a sample suspected of having the polypeptide; (11) a method of identifying a compound that inhibits or in a mammal; (12) a method of identifying a compound that inhibits or in mammal; (13) a method of stimulating the immune response in a mammal; (13) a method of stimulating the immune response in a mammal; (13) a method of stimulating the immune response in a mammal; (13) a method of stimulating the immune response in a mammal; (13) a method of stimulating the immune response in a mammal; (14) a method of stimulating the immune response in a mammal; (15) a method of stimulating the immune response in a mammal; (16) a method of stimulating the immune response in a mammal; (17) a method of stimulating the immune response in a mammal; (18) a method of stimulating the immune response in a mammal; (18) a method of stimulating the immune response in a mammal; (18) a method of stimulating the immune response in a mammal; (18) a method of stimulating the immune response in a mammal; (18) a method of stimulating the immune response in a mammal; (18) a method of stimulating the immune response in a mammal; (18) a method of stimulating the immune response in a mammal; (18) a method of stimulating and subsection antialished and subsection antialished and subsection antialished and subsection antialished and subsection antialished haemostatic, hepatotropic, immunostimulant, immunosuppressive, muscular, nephrotropic, neuroprotective, osteopathic, respiratory, vasotropic and virucide activities, and can be used in gene therapy. The nucleic acid of la and the encoded polypeptides, compositions, kits and methods are useful in diagnosing and treating an immune related disease and in stimulating an immune response. The present sequence represents a human stimulating an immune response. The present sequence PRO nucleotide sequence from the present invention.

This invention relates to the CDNA sequences encoding an isolated novel human polypeptide. The protein encoded by the nucleic acid of the invention is useful for treating central and peripheral nervous system disease, amyotrophic diseases (e.g. peripheral neuropathy, Huntington's disease, amyotrophic clateral sclerosis); neurodegenerative disease (e.g. parkinson's disease, amyotrophic content of a utoimmune disease (e.g. systemic lupus erythematosius, rheumatoid arbhritis, insulin-dependent diabetes mellitus) cryweloid or lymphoid cell disorders (e.g. osteoporosis, serthemis; bone disorders (e.g. osteoporosis, osteoarthritis); mechanical and traumatoid injury in various tissues; osteoarthritis); mechanical and traumatoid disorders (e.g. osteoporosis, osteoarthritis); asthma; coagulation disorders (e.g. baemophilia); cancer and tumours; and inflammatory diseases (e.g. septic shock, Crohn's disease, anaphylaxis). The protein may be used to inhibit the growth, inflection or function of infections agence such as bacteria, fungi, cviruses, or to effect bodily characteristics, biorhythms or circadian cycles of rhythms. The protein may also have

Cycles of rhythms. The protein may also have

Cycles of rhythms. The protein may also have

Cycles of rhythms. The protein may also have

Cycles of rhythms. The protein may also have

Cycles of rhythms. The cyclein may also have

Cycles of thythms. The cyclein for may also have

Cycles of thythms. The cyclein for may also have

Cycles of thythms. The cyclein for may also have

Cycles of thythms. The cyclein for may also have

Cycles of thythms and thrombolytic, receptor/ligand, and antinflammatory

Crecubinant protein for analysis. The present sequence is an expressed of human cDNA sequence of the invention, this sequence is an expressed of sequence tag (EST) and was identified using subtractive hybridisation

```

```
This sequence represents cDNA encoding a human ceramide kinase designated hCERKI. The invention relates to hCERKI, nucleic acids encoding it, expression vectors and host cells containing hCERKI nucleic acids, the recombinant production of hCERKI and antibodies specific for hCERKI. The invention also encompasses methods of isolating hCERKI from samples, the use of hCERKI in drug screening, and the use of hCERKI nucleic acid sequences in gene therapy, hCERKI mediates the ATP-dependent 1-phosphorylation of ceramides and can be used to screen for therapeutic and preventive agents for a wide range of disorders. Such disorders
  include neurological disease, inflammation, human immunodeficiency virus (HIV) infection, type 2 diabetes, obesity, sepsis, arteriosclerosis and
Human ceramide kinase gene and the enzyme encoded by it for screening substances as drugs for neurological, inflammatory and other disorders.

Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.

Claim 20; SEQ ID NO 39; 395pp; English.

The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or creat a medical condition in human related to the aberrant expression and activity of NOVX by supplementing the patient our polymucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polypucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. The anti-NOVX polypeptides antibodies, agonists and antagonists may also be used as antions and reat: meatbolic disorders dispression and activity of NOVX colypeptides. The anti-NOVX polypeptide antibodies and polymucleotide expression and activity of NOVX polypeptides and polymucleotide expression and activity of NOVX colypeptides. The anti-NOVX polypeptide antibodies may be used in this way to prevent, diagnostic agents for detecting the presence of NOVX in samples. NOVX colypeptides and polymucleotide may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, inmune disorders, and discusses, matching disorders, and the various dyslippidaemias, metabolic wasting disorders associated with obesity, the metabolic syndome X and various and polymucleotide with diseases and various cancer. They may also be used as antibactorial agents. Human; sphingosine kinase; SphK; restenosis; ischaemia; gene therapy; antisense therapy; cancer; sphingolipid; signalling molecule; apoptosis; cytostatic; tumour necrosis factor-alpha; TNF; atherosclerosis; lymphoma; leukaemia; vasotropic; cell proliferative disorder; vascular disease; ss.
  An isolated Sphingosine kinase polypeptide useful for treating a SphK-associated disorder especially cancer, restenosis or ischemia in a human.
  The present invention relates to sphingosine kinase (SphK) polypeptides and nucleic acids encoding them. SphK is useful for treating a SphK-associated disorder especially cancers such as leukaemia, lymphoma, ovarian, breast, lung, colon, testicular, stomach and skin, atherosclerosis, restenosis or ischaemia and cell proliferative disease or disorder associated with vascular diseases. SphK gene is used in gene therapy and antisease-therapy. Sphingolipids serving as signalling molecules, have recently emerged as regulators of cell growth, diverse cell phenotypes and cell death. Activation of SphK by tumour necrosis factor (TMF) -alpha inhibits apoptosis in human endochleial cells. The present sequence is human sphingosine kinase

sphingosine to form sphingosine 1-phosphate. The polymucleotide was isolated from an HeLa CDNA library by PCR amplification. The invention provides polymucleotides (see AAA55060-10) and polypeptides (see AAY56057-59) for the human sphingosine kinase (SK) homologues SKA, SKB and SKC. The polymucleotides may be used as hybridization probes, in the construction of PCR primers for chromosome and gene mapping, in the recombinant production of SKA, SKB and SKC, and in the generation of antisense DNA or RNA. They can be used to detect inflammation or disease associated with abnormal levels of SK expression, or to detect individuals. Host cells expressing SK can be used in drug screening. Human SK specific antibodies, inhibitors, ligands or their analogues are useful as bloactive agents to treat inflammation or disease including viral, bacterial or fungal infections, allergic responses, mechanical injury associated with trauma, hereditary diseases, lymphoma or carrier conditions with activate the genes of kidney, lung, corrections, and other conditions with activate the genes of kidney, lung,

  A Y;
  The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cytostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoietic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting wound healing. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic DNA of the invention. The current sequence is not shown explicitly within the specification but can be accessed from the WIPO web-site.

reaction (FCR) primers, oligomers, and for chromosome and gene mapping, reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at the sequences.

  system
   The invention relates to a human sphingosine kinase-like protein. The polypeptide can be expressed by standard recombinant methodology. The sphingosine kinase-like protein and gene can be used to regulate intracellular signalling and consequently cell proliferation and apoptosis. Such regulation is useful for treating cancer, allergies (e.g. asthma), autoimmune diseases (e.g. rheumatoid arthritis) and central and peripheral nervous system disorders (e.g. rexkinson's disease). The present sequence represents the human sphingosine kinase-like protein
   Human sphingosine kinase-like protein; intracellular signalling; gene; cell proliferation; apoptosis; cancer; allergy; cytostatic; asthma; autoimmune disease; rheumatoid arthritis; Parkinson's disease; ss.
                          New reagent for modulating the activity of sphingosine kinase-like protein polypeptide or polynucleotide and treating cancer, asthma, allergy, an autoimmune disease, or a central or peripheral nervous disorder.

   The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed cannot be added to the control of (II) or to treat disease states involving (II). (II) is a useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating and its binding partners are useful in medical imaging colypeptide in tissue, as molecular weight markers and as a food supplement. (II) and (II) are useful for treating disorders involving abberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forenise, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cannot acid sequences of the invention. Note: The sequence data for this parent did not appear in the printed specification, but was obtained in elective format directly from NIPO at
